SKILLS

Languages:	C, C++, Python, HTML, CSS, JavaScript
Libraries/Frameworks:	NumPy, Pandas, Matplotlib, Seaborn, Scikit-learn
Tool/Platforms:	Linux, MySQL, Google Colab, Jupyter Notebook
Soft Skills:	Analytical-Thinking, Problem-Solving, Team Collaboration, Consistency

PROJECTS

Car Price Prediction | Scikit-learn , NumPy, Pandas, Matplotlib, Seaborn | GitHub — Oct' 25

- Faced missing and inconsistent values across multiple features like horsepower, bore, and price. Resolved using mean/mode imputation and row filtering, resulting in a clean and reliable dataset.
- Raw features had different scales, causing unstable model learning and poor convergence. Applied normalization and standard scaling, which improved training stability and model performance
- Categorical variables could not be directly used in regression models. Implemented **One-Hot Encoding** via **ColumnTransformer**, enabling seamless model training.
- The initial model showed signs of overfitting training data. Used **Ridge and Lasso regularization** to improve generalization on unseen test data.
- Too many features reduced interpretability and added noise to predictions. Applied **SelectKBest feature selection**, improving model simplicity and predictive accuracy.
- Model performance was hard to interpret numerically alone. Used **R^2, MSE, residual plots, and KDE plots** to validate strong prediction quality.

Diabetes Prediction | Scikit-learn , NumPy, Pandas, Matplotlib, Seaborn | GitHub — Oct' 25

- Built a supervised classification model to predict diabetes from healthcare data with strong class imbalance. Focused on recall optimization to reduce false negatives in medical diagnosis.
- Performed data preprocessing including encoding, scaling, and outlier handling. Used visual and statistical analysis to ensure data quality and feature relevance.
- Engineered a suite of classification models (Logistic Regression, SVM, Decision Tree, Random Forest) to predict diabetes. Evaluated performance using recall, F1-score, and confusion matrix metrics.
- Applied hyperparameter tuning using GridSearchCV and RandomizedSearchCV. Improved model performance through class weighting and threshold adjustment.
- The initial model achieved **88% accuracy** with **88% recall** for diabetic cases but low **41% precision**, indicating many false positives due to class imbalance.
- After optimization, the final model reached **95% accuracy** with **76% recall** and **70% precision**, providing a more balanced and reliable prediction performance.

TRAINING

Cipher Schools — Jun' 25 – Jul' 25

Data Structures and Algorithms

- Completed a **project-based, hybrid training program** with self-paced technical modules and live interactive doubt-solving sessions, emphasizing practical implementation and consistency.
- Built **mini and major real-world projects**, including end-to-end problem formulation, development, and presentation, improving hands-on and industry readiness.
- Participated in **Learn in Public** and **Cipher Tank project pitching**, presenting solutions to industry experts and gaining exposure to referrals, grants, and professional feedback.
- Earned certification through continuous evaluation, community engagement, and performance-based recognition, with lifetime access to learning resources and internship readiness support.

ACHEIVEMENTS

Solved 300+ DSA and algorithmic problems across LeetCode and GeeksforGeeks — Dec' 24 – Present

EDUCATION

Lovely Professional University — Phagwara, Punjab
Bachelor of Technology - Computer Science and Engineering (AI and ML) — Aug' 23 - Present
CGPA: 7.2
